

Docket No. 6173-29US

Please amend the Abstract as follows:

Abstract of the Disclosure

An emergency telephone call is supported and routed to a Public Safety Answering Point (PSAP) in an IP based packet switched wireless communications network. An activate PDP context request is sent from a user equipment to the network. A parameter in said the activate PDP context request indicates that the PDP context will be used to transfer an emergency call. An activate PDP context accept message is returned from said the support node to said the user equipment. The Said activate PDP context accept message acknowledges said the activate PDP context request message and provides the address of a call state control function. A call setup request transferred to the call state control function includes the Service Area Identity (SAI). The call state control function selects a PSAP based, at least in part, on the SAI included in the call setup request and forwards the emergency call to the selected PSAP.
